## (54) LIGHT-EMITTING ELEMENT

### (57)Abstract:

**PROBLEM TO BE SOLVED:** To provide a light-emitting element which regulates minimum exciting triplet energy level, ionized potential and electron mobility of an electron transport material having a laminated two-layer type or laminated three-layer type structure, and which also has a good emission efficiency and brightness by including phosphorescent compound, enables to cover a wide area when at least one layer of organic compound layers is formed with a wet film-forming method, and reduces manufacturing cost.

**SOLUTION:** In a light-emitting element forming an organic compound layer between at least a pair of electrodes provided on a base material, the organic compound layer consists of at least two layers which are a light-emitting layer including a hole transport material and a phosphorescent compound, and an electron transport layer including an electron transport material.
